

Device to sweep off bees - operating instruction

- Put the device beside the beehive, plug in an accumulator 7,2 V NiMh and turn it on. With the inserted battery (3000 Ah) several hundred frames of bees can be swept off.
- hold a frame with bees above the scrubbers – now the device will start automatically
- move the frame quickly down and up – now repeat this step with the next frames
- after the last frame was swept off take the device by the grip, lift it up and remove the catching box with the bees inside
- with a quick movement the bees are rammed on the bottom of the box
- for emptying keep the box over the supposed beehive and half pull out the slider
- with a little hitch the bees fall into the beehive
- switch off the device after the procedure is finished
- during operation you don't have to clean the device
- by turning the lock by 90 °, the left brush bearings can be removed, for making it easy to remove the brushes for cleaning. Clean the brushes in a bucket with water. Clean up the inner surface with a wet towel
- do not lay any objects on the scrubbers, they would bend out of shape!
- attention: never store the device uncharged for long periods - the battery may be defective.

Technical data:

Power unit with accumulator 7,2 V NiMh, incl. changing accumulator 3000 mAh and incl. battery charger
weight: ca. 10 kg
dimensions: 630x350x450 mm
able for all current frames (inclusive Dadant)

bee catching box with slide: within room for bees of approx. 10 frames
